

## Binomial Theorem With Non-Linear Terms Practice

Use the following information to answer the first question.

When determining the constant term in the expansion of

$$\left(5x^2 + \frac{1}{x}\right)^9$$

The work for the first step in finding K is shown below.

Step 1	$(5x^2 + (x^{-1}))^9$
Step 2	$((x^2)^{9-k})(x^{-k}) = x^0$
Step 3	$(x^{18-k})(x^{-k}) = x^0$
Step 4	$(x^{18-2k}) = x^0$
Step 5	$18 - 2k = 0$
Step 6	$k = 9$

1. Unfortunately an error was made. The step where the first error occurred **and** the correct value of k are

- A) Step 3 **and** k = 4
- B) Step 3 **and** k = 6
- C) Step 4 **and** k = 4
- D) Step 4 **and** k = 6

2. The constant term in the expansion of  $\left(x - \frac{4}{x^2}\right)^{12}$  is

- A) 495                      B) 1020                      C) 50 680                      D) 126 720

3. Given  $\left(m + \frac{1}{m}\right)^n$  with  $k = 2$ , the value of the constant term is \_\_\_\_\_.

Use the following information to answer the next question.

Consider the following expressions.	
<b>A.</b> $(x + 3y)^3$	<b>B.</b> $\left(x + \frac{1}{x}\right)^4$
<b>C.</b> $(2x - y)^5$	<b>D.</b> $\left(x^3 - \frac{3}{x^2}\right)^7$

4. When expanded, which expression will have a constant term?

A) A                      B) B                      C) C                      D) D

5. The constant term in the expansion of  $\left(\frac{3}{x} + 2x^3\right)^{12}$  is a number over 34 million that can be written in the form 34 KMN 080, where K, M, and N are integers. The values for K, M, and N respectively, are

A) 531  
B) 642  
C) 814  
D) 702

6. The constant term in the expansion of  $\left(\frac{x^2}{2} + \frac{m}{x}\right)^6$  is 60. Determine possible values of  $c$ . Show all work.

## Binomial Theorem With Non-Linear Terms Practice Solutions

Use the following information to answer the first question.

When determining the constant term in the expansion of

$$\left(5x^2 + \frac{1}{x}\right)^9$$

The work for the first step in finding K is shown below.

Step 1	$(5x^2 + (x^{-1}))^9$
Step 2	$((x^2)^{9-k})(x^{-k}) = x^0$
Step 3	$(x^{18-k})(x^{-k}) = x^0$
Step 4	$(x^{18-2k}) = x^0$
Step 5	$18 - 2k = 0$
Step 6	$k = 9$

1. Unfortunately an error was made. The step where the first error occurred **and** the correct value of k are

- A) Step 3 **and** k = 4
- B) **Step 3 and k = 6**
- C) Step 4 **and** k = 4
- D) Step 4 **and** k = 6

### Solution

The error was made in step 3. In the first power, k was not multiplied by 2. Instead of  $(x^{18-k})(x^{-k}) = x^0$ , it should be  $(x^{18-2k})(x^{-k}) = x^0$ .

The next step should be  $(x^{18-3k}) = x^0$ , followed by

$$18 - 3k = 0.$$

$$18 = 3k$$

$$6 = k.$$

**The correct answer is B.**

2. The constant term in the expansion of  $\left(x - \frac{4}{x^2}\right)^{12}$  is

A) 495

B) 1020

C) 50 680

D) 126 720

**Solution**

For the first step in finding k, rewrite letters in the denominator in an equivalent form and then remove any coefficients.

$$(x - 4x^{-2})^{12}$$

$$((x)^{12-k})(x^{-2k}) = x^0$$

$$12 - 3k = 0$$

$$12 = 3k$$

$$4 = k$$

Now use the general term to determine the constant term.

$$t_{k+1} = {}_n C_k x^{n-k} y^k$$

$$t_{4+1} = {}_{12} C_4 (x)^8 \left(-\frac{4}{x^2}\right)^4$$

$$t_5 = (495) (x^8) \left(\frac{256}{x^8}\right)$$

$$t_5 = 126 720$$

**The correct answer is D.**

3. Given  $\left(m + \frac{1}{m}\right)^n$  with  $k = 2$ , the value of the constant term is 6.

**Solution**

Rewrite the second term in the binomial in an equivalent form.

$$(m - m^{-1})^n$$

Determine the value of  $k$ .

$$((m)^{n-k})(m^{-k}) = m^0$$

Substitute  $k = 2$

$$(m^{n-2})(m^{-2}) = m^0$$

$$(m^{n-4}) = m^0$$

Since the bases are the same, set the exponents equal.

$$n - 4 = 0$$

$$n = 4$$

$$t_{k+1} = {}_n C_k x^{n-k} y^k$$

$$t_{2+1} = {}_4 C_2 (m)^2 \left(\frac{1}{m}\right)^2$$

$$t_3 = (6) (m^2) \left(\frac{1}{m^2}\right)$$

$$t_3 = 6$$

**The value of the constant term is 6.**

Use the following information to answer the next question.

Consider the following expressions.	
<b>A.</b> $(x + 3y)^3$	<b>B.</b> $(x + \frac{1}{x})^4$
<b>C.</b> $(2x - y)^5$	<b>D.</b> $(x^3 - \frac{3}{x^2})^7$

4. When expanded, which expression will have a constant term?

A) A

B) B

C) C

D) D

**Solution**

Options A and C both have two separate letters, so every term in the expansion will have at least one letter, i.e. no constant.

For options B and D, check to see if there is an integer value for k. If so, there would be a constant.

The value of k in option B is 2. The value of k in option D is 4.2.

**The correct answer is B.**

5. The constant term in the expansion of  $(\frac{3}{x} + 2x^3)^{12}$  is a number over 34 million that can be written in the form 34 KMN 080, where K, M, and N are integers. The values for K, M, and N respectively, are

A) 531

B) 642

C) 814

D) 702

Solution

Step 1 – Determine the value of k.

$$(3x^{-1} + 2x^3)^{12}$$

$$((x^{-1})^{12-k})(x^{3k}) = x^0$$

$$(x^{-12+k})(x^{3k}) = x^0$$

$$(x^{-12+4k}) = x^0$$

$$-12 + 4k = 0$$

$$4k = 12$$

$$k = 3$$

Step 2 – Use the general term

$$t_{k+1} = {}_n C_k x^{n-k} y^k$$

$$t_{3+1} = {}_{12} C_3 \left(\frac{3}{x}\right)^9 (2x^3)^3$$

$$t_4 = (220) \left(\frac{3^9}{x^9}\right) ((2^3)(x^9))$$

$$t_4 = 34\,642\,080$$

**The correct answer is B.**

6. The constant term in the expansion of  $\left(\frac{x^2}{2} + \frac{m}{x}\right)^6$  is 60. Determine possible values of  $c$ . Show all work.

**Solution**

Rewrite without coefficients and with moving the variable in the denominator to the numerator.

$$(x^2 + x^{-1})^6$$

Find  $k$ .

$$(x^2 + x^{-1})^6$$

$$((x^2)^{6-k})(x^{-k}) = x^0$$

$$(x^{12-2k})(x^{-k}) = x^0$$

$$(x^{12-3k}) = x^0$$

$$12 - 3k = 0$$

$$12 = 3k$$

$$k = 4$$

Use the general term.

$$60 = {}_6C_4 \left(\frac{x^2}{2}\right)^2 \left(\frac{m}{x}\right)^4$$

$$60 = {}_6C_4 \left(\frac{x^4}{4}\right) \left(\frac{m^4}{x^4}\right)$$

$$60 = (15) \left(\frac{m^4}{4}\right)$$

$$240 = (15)(m^4)$$

$$16 = m^4$$

Take the 4<sup>th</sup> root of both sides.

$$m = \pm 2$$

**The possible values of  $m$  are  $\pm 2$ .**
